

Clinical research methodology

From research question to defensible result.

APPROACH

Good clinical research is decided before the first patient is enrolled. We work alongside investigators and research teams from the moment a question takes shape, so that the design answers it, the sample size is justified, the analysis is pre-specified and the result can stand up to peer review.

TEAM

We are methodologists and biostatisticians, not a black box: every deliverable comes with the reasoning behind it and with code you can re-run.

LOREM IPSUM

What we offer

Study design and protocol development

- Randomised trials: parallel, cluster, crossover, non-inferiority, adaptive and platform designs
- Observational studies: cohort, case-control, cross-sectional, registry-based and real-world evidence
- Diagnostic and prognostic studies, prediction-model studies
- Estimand framing (ICH E9(R1)), outcome hierarchy, handling of intercurrent events
- Protocol sections written to SPIRIT, STROBE, CONSORT, STARD and TRIPOD+AI reporting standards
- Feasibility assessment of eligibility criteria and recruitment assumptions

Turning a clinical question into a study that can answer it – choosing the design, the population, the comparator, the outcomes and the estimand.

Sample size, power and simulation

- Power and sample-size calculation for superiority, non-inferiority and equivalence designs
- Simulation-based power for complex designs: hierarchical, longitudinal, survival with non-proportional hazards, composite and ordinal outcomes
- Operating characteristics of adaptive and group-sequential designs
- Sensitivity analyses across effect sizes, drop-out, variance and recruitment assumptions
- A short, readable sample-size memo ready to be pasted into a protocol or grant

Analytical calculations where they apply, simulation where they don't – with transparent assumptions and sensitivity scenarios you can defend to a committee or a reviewer.

Statistical analysis plan

- Randomised trials: parallel, cluster, crossover, non-inferiority, adaptive and platform designs
- Observational studies: cohort, case-control, cross-sectional, registry-based and real-world evidence
- Diagnostic and prognostic studies, prediction-model studies
- Estimand framing (ICH E9(R1)), outcome hierarchy, handling of intercurrent events
- Protocol sections written to SPIRIT, STROBE, CONSORT, STARD and TRIPOD+AI reporting standards
- Feasibility assessment of eligibility criteria and recruitment assumptions

Turning a clinical question into a study that can answer it – choosing the design, the population, the comparator, the outcomes and the estimand.

PROCESS

How an engagement works

Amet, consectetur adipiscing elit, sed do eiusmod tempor incididunt ut labore et dolore magna

01 Discovery call

A short conversation to understand the research question, the stage of the project, constraints and timelines. Free, no commitment.

02 Scoping and proposal

We write down what will be delivered, by when and at what cost, and we flag the methodological risks we already see.

03 Work with checkpoints

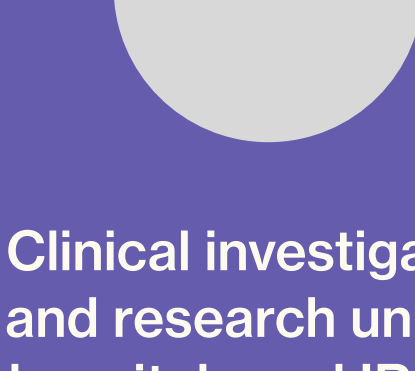

We work in short, reviewable increments. You see intermediate results early – a draft sample-size memo, a screening sample, an analysis mock-up – so nothing arrives as a surprise.

04 Deliverables and handover

Documents, code and data dictionaries are delivered in a form your team can re-run and build on. We remain available for questions, reviewer responses and follow-up analyses.

WHO IT IS FOR

Typical clients

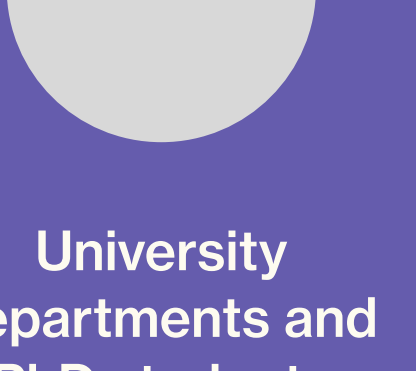

Clinical investigators and research units in hospitals and IRCCS

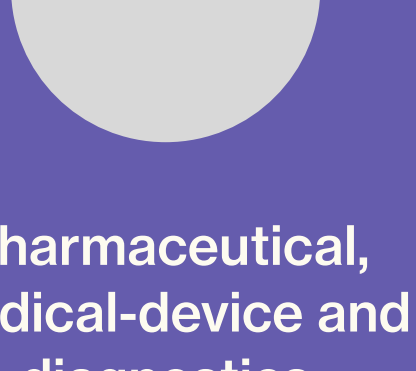

Scientific societies running registries or multicentre studies

Contract research organisations needing overflow or specialist capacity

University departments and PhD students

Pharmaceutical, medical-device and diagnostics companies

DOES ANOTHER USERS ALREADY ASKED WHAT YOU ARE LOOKING FOR?

Frequently Asked Questions

Which software do you use?

Can you join a project that is already running?

Do you co-author?

When our contribution meets authorship criteria (ICMJE) we are glad to co-author; otherwise an acknowledgement is fine. We agree on this at the proposal stage, not at submission.

SERVICES

Are you looking for something else?

Discover what else we offer.

EVIDENCE-BASED MEDICINE

Evidence synthesis and guidelines

Evidence, synthesised rigorously – and faster.

Study design, sample size and simulation, statistical analysis plans, analysis and reporting – for trials, observational studies, registries and real-world evidence.

- Study design and protocol development
- Sample size, power and simulation
- Statistical analysis plans
- Statistical analysis and reporting
